03-Feb-17 15:52:00 Coxsackie A Serotype 9 Titer:
 INTERPRETIVE INFORMATION: Coxsackie A Serotype 9 Titer

Single positive antibody titers of greater than 1:32 may indicate past or current infection. Seroconversion or an increase in titers between acute and convalescent sera of at least fourfold is considered strong evidence of current or recent infection.

03-Feb-17 15:52:00 Coxsackie B Virus Antibody Type 6:
 INTERPRETIVE INFORMATION: Coxsackie B Virus
 Single positive antibody titers of greater than or equal to 1:80 may indicate past or current infection. Seroconversion or an increase in titers between acute and convalescent sera of at least fourfold is considered strong evidence of current or recent infection.

03-Feb-17 15:52:00 Echovirus Antibody Type 30:
 INTERPRETIVE INFORMATION: Echovirus Antibodies
 Single positive antibody titers of greater than or equal to 1:80 may indicate past or current infection. Seroconversion or an increase in titers between acute and convalescent sera of at least fourfold is considered strong evidence of current or recent infection.

03-Feb-17 15:52:00 Polio Virus Antibody Type 3:
INTERPRETIVE INFORMATION: Poliovirus (Types 1, 3) Antibodies

Less than 1:10: No detectable poliovirus antibodies.
1:10 or greater: Antibody to poliovirus detected, which may represent prior immunization or current or past infection.

The presence of neutralizing antibodies against poliovirus implies immunity. The serum neutralization test is serotype specific. Antibodies against one type does not indicate immunity against the other type.

Reference interval applies to Poliovirus Antibodies Types 1 and 3.
